

## HRE – RECENT VALUES – OVERVIEW

### Revision history

2018-06-04	Robin Lamacraft	Original draft
2023-07-15	Don Ferguson	Aligned with Build 30

### SCOPE

Some user data and GUI configuration selections on GUI windows have **recently used** value lists, or **favourites** lists. There are keyboard and selected field mouse methods to use values from these lists to speed up data entry or swap between aspects of workflow. Both these lists may be saved as part of a Project and so continue over sessions.

- **RECENT VALUES LIST:** has a fixed maximum number of entries (typically 10)
  - The most recently used value is at the bottom of the list
  - If a value not in the recently used list is entered then it pushes the list up and the new value becomes the bottom entry, while the oldest entry is discarded
  - If a value already in the list is reused, then it becomes the bottom of the list and the other entries are moved as required
  - Depending on context, this behaviour of a list may be implemented in the reverse, i.e. most recent at the top.
- **FAVOURITE VALUES LIST:** the User can enter and reorder these values. A selection action can copy a value into a selected field on another window.

### DATABASE

Table **T112** has one record for each values list that is maintained over project shut-down/restart.
